# DESING A WEBSITE

These are the trhee steps we will follow to create a web site

WIREFRAME

The first step is to create the plan or scheme of the web page, a very visual guide, what we know as "wireframe". Here we will be able to observe how we order the different elements that we want to appear in the web page. We have to take into account that not only the main page has to be designed, but also all the other pages.

STYLE GUIDE

The second step is one of the most critical. In it we have to create the image and the brand that can lead you to success. For this we have to decide the logo and the brand, the color scheme, choose the typography we want to use, the size of it, the icons, the size of the images, etc.

CODE

The last step, probably the one that takes the most time. Develop the web page in our work environment. In our case using the framework called Bootstrap.
